

Food-Tech Business Intelligence

Delivery Operations Dashboard

Internal Strategy Report | Confidential

Project Overview

This business intelligence project transforms a cluttered, raw food-tech dataset into a structured, high-performance Star Schema data model within Power BI. The objective is to evaluate macroeconomic performance, analyse customer cohort behaviours, assess catalogue and cuisine dynamics, and isolate operational bottlenecks across regional markets.

The data model ingests four core tables:

Table	Description
dim_restaurant	Granular details including names, locations, ratings, votes, and cost brackets.
fact_orders	Transactional records containing order volumes, timestamps, order values, and status variables.
dim_customers	Unique customer profiles, signup dates, and localized demographic details.
dim_datetable	A continuous calendar dimension supporting time-intelligence logic.

Using calculated columns and advanced DAX measures, raw transactional metrics were converted into high-impact corporate KPIs distributed across four distinct dashboard views.

Data Architecture and Core KPIs

The backend leverages robust data modelling and clean relationships to calculate primary operational metrics:

Total Revenue	Total Orders	Registered Restaurants	Avg. Order Value	Platform Rating
Rs. 156.1M	189K	56K	Rs. 824.31	3.70 / 5.0

Deep-Dive Insights by Dashboard View

1. Executive Revenue and Market Overview

Macro-Trend Fractures

Both the Orders Trend and Revenue Trend display historical stability between January 2023 and mid-2025, operating on a predictable cyclic band fluctuating tightly between Rs. 4.5M and Rs. 5.0M in monthly revenue. However, Q4 2025 exhibits a severe macro cliff-drop, where revenue plummets toward Rs. 4.0M and total orders break down below the 5K baseline. This indicates an urgent platform-wide retention or technical

infrastructure issue at the end of the year.

Geographic High-Value Clusters

Market revenue concentration is highly top-heavy. The absolute market leader dominates with Rs. 15.4M in total revenue. The market matrix drops to a secondary tier led by two high-performing areas generating Rs. 7.6M and Rs. 7.5M respectively, followed by a tight mid-market cluster ranging from Rs. 6.5M down to Rs. 3.8M.

2. Customer Cohort and Lifecycle Analytics

Volume Distribution by Segment

- New Customers: Drive the highest operational load with 42K orders.
- Returning Customers: Form a reliable pillar accounting for 34K orders.
- Premium Customers: Represent a high-margin but underpenetrated cohort at 8K orders.

Retention Health Check

Out of 19K total customers captured on the platform, 10K are classified as recurring customers, indicating a strong 50.21% repeat customer rate.

Acquisition Pipeline

The Signup Trend mirrors the revenue timeline, maintaining an average channel rate of approximately 5,000 signups per month before mirroring the Q4 2025 drop-off down toward the 4K floor.

3. Restaurant and Culinary Performance

Cuisine Demand Distribution

Menu optimisation is highly concentrated. The top-tier cuisine acts as a massive customer magnet, yielding 41K orders -- outperforming the second-place cuisine (17K orders) and third-place cuisine (15K orders) combined. The remaining categories exhibit a long-tail distribution sloping down from 10K to 6K orders.

The Rating Plateau

Despite clear stratification in order volume across cost buckets (Budget, Mid-Range, and Premium), the average rating remains aggressively flat at 3.70 across all segments. High prices in the Premium bucket are not yielding superior customer satisfaction metrics, indicating a potential value-for-money gap.

4. Logistics and Operational Health

Fulfillment Failure Rate

Out of 189K total orders, the platform registered 91K late orders and 19K total cancelled orders. This results in a highly concerning 9.96% platform cancellation rate, introducing immense operational waste and churn risk.

Systemic Speed Barriers

The average delivery time is fixed at 44.56 minutes. Variance across high-value markets shows that transit speeds are systematically bottlenecked -- the slowest major market averages 44.85 minutes while the fastest manages only 44.32 minutes, indicating that local geography or structural dispatch errors are capping delivery velocity regardless of the zone.

Localized Crisis Identification

The regional operational matrix isolates exactly where the system is breaking down:

City Location	Cancelled Orders	Delayed Orders	Delivered	Total Load
BTM	1,876	1,854	14,955	18,685

HSR	938	893	7,257	9,088
JP Nagar	796	777	6,299	7,872
Jayanagar	723	715	5,653	7,091
Indiranagar	706	754	5,992	7,452

BTM handles the largest volume load on the platform (approximately 18.6K total orders) but is plagued by severe failure rates, leaking 1,876 cancellations and 1,854 major delays. HSR represents the second-highest operational stress point with 938 cancellations and 893 delays.

Core Tactical Recommendations

1. Deploy BTM and HSR Logistics Taskforce

Address the high cancellation volumes in BTM and HSR immediately. Implement localized driver supply incentives, optimize hyper-local dispatch radii, or run audit checks on top-volume restaurants in these zones to solve prep-delay issues.

2. Investigate the Q4 2025 Revenue Cliff

The steep, concurrent drop in signups, order trends, and revenue at the tail-end of 2025 suggests an unaddressed technical update failure, major competitive entry, or aggressive reduction in marketing spend. Run a weekly cohort analysis for Q4 2025 to trace exact user churn dates.

3. Premium Segment Penetration

Premium customers currently contribute only 8K orders despite an attractive overall AOV of Rs. 824.31. Launch targeted cross-merchandising campaigns to convert the 34K returning customer base into high-tier premium subscribers.

4. De-bottleneck Delivery Times

Because delivery times are stubbornly flat between 44.32 and 44.85 minutes across all major cities, operations should pivot toward pre-sorting orders or introducing batch-delivery algorithms to maximise efficiency.
